

# BLEEDING

Bleeding occurs when the blood vessels have been damaged and cannot clot, which can become life-threatening in minutes. Quick action saves lives.

## Important Actions!

### Check Safety

Make sure the area is safe for both you and the injured person before treating.

### Protect Yourself

Always use barriers such as gloves, or even plastic bags, or between you and blood.

### Call For Help

If the casualty has lost a lot of blood, or if you are unable to control bleeding, call for an ambulance immediately.

## How To Manage Bleeding

### Identify

Find and examine the source of bleeding.

Look for any objects in the wound. If there is, do not remove it.

### Pressure

With a wound pad, gauze or even clothing, apply firm, direct pressure to the wound.

If there is an object visible, apply pressure around the object.

### Dressing

Once bleeding has stopped, apply a First Aid dressing over the gauze.

Make sure it is tight, but not stopping blood flow.

### Clean-Up

ALWAYS dispose of contaminated items like gloves/dressings safely.

If your skin had contact with blood, wash thoroughly with soap.
